

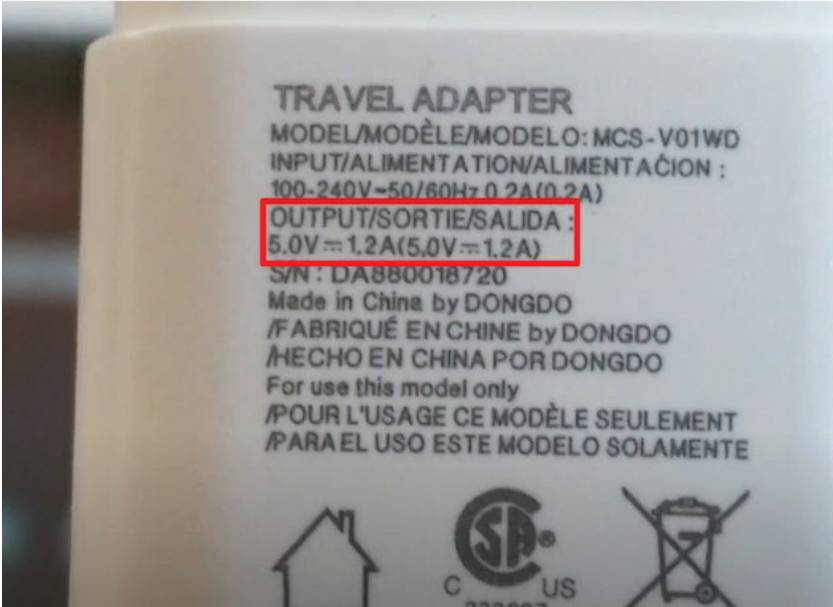

Exhibit 5 – U.S. Patent No. 10,855,087 Claim Chart

Claim	Analysis (All Emphasis Added)
<p>[1.P] A power supply system comprising: power circuitry configured to provide direct current power.</p>	<p>LG makes, uses, sells, offers for sale and imports a power supply system comprising power circuitry configured to provide direct current power.</p> <p>This element is infringed literally, or in the alternative, under the doctrine of equivalents.</p> <p>For example, LG provides cell phones (“portable electronic device”) including but not limited to LG G7 fit, LG G8X Thin Dual Screen, LG K30, LG K51, LG K92, LG Phoenix 4, LG Prime 2, LG Q70, LG Q70, LG Stylo 5x, LG Stylo 6, LG V30, LG V35 ThinQ, LG V40 ThinQ, LG V60 ThinQ 5G Dual Screen, LG VELVET 5G, LG WING 5G, LG Xpression Plus 3, LG V40 5G, LG V40 Lite, LG V50S ThinQ 5G, and LG V50 ThinQ 5G. LG provides a Travel Power Adapter that ships with the phones and acts as a power supply while charging the phone. The adapter outputs voltage, current, and power values.</p> <p>Upon information and belief, the Travel Power Adapter uses the Battery Charging (BC) 1.2 specification to charge the portable electronic device. The Table 2-1 (https://www.usb.org/sites/default/files/USB%20Type-C%20Spec%20R2.0%20-%20August%202019.pdf, page 36) and the diagram depicting the power consumed by different USB specifications (https://usb.org/sites/default/files/D2T2-1%20-%20USB%20Power%20Delivery.pdf, page 5) disclose that BC 1.2 is used to output 5V voltage, 1.5A current, and 7.5W power. The voltage and current values mentioned on the Travel Power Adapter correspond to output voltage and current of 5V and 1.2A respectively. Hence, the adapter charges the portable electronic device using the BC 1.2 specification.</p>

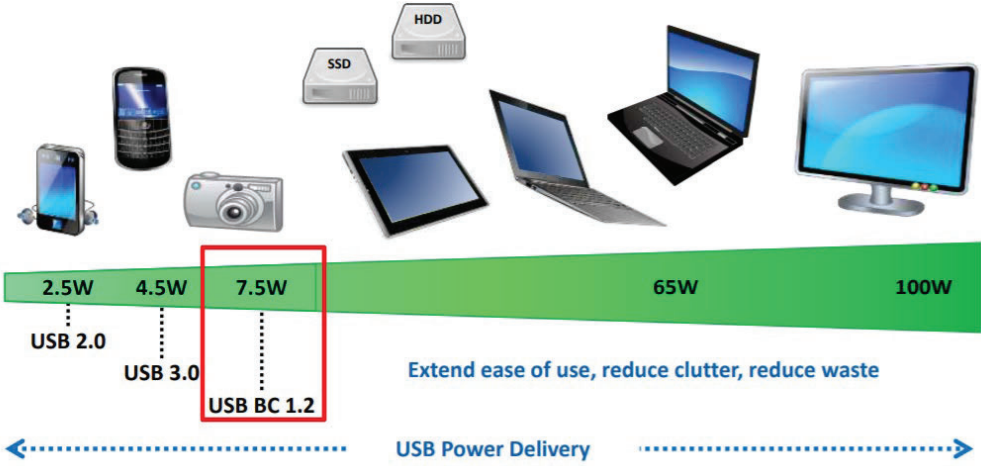

Claim	Analysis (All Emphasis Added)
	<p>USB battery charging specifications</p> <p><u>Battery Charging Specification Revision 1.2 (BC1.2)</u></p> <p>The different port types described in the above section were first defined in the <i>Battery Charging Specification Revision 1.2</i> (BC1.2) published in 2010. In addition to the port definitions, BC1.2 specifies primary and secondary charge port detection sequences and port specific performance requirements. These include required operating range, undershoot, detection signaling, and connectors for each port type. Also included are dead, weak, and good battery charge conditions, port shutdown procedures, and other details associated with battery charging.</p> <p>BC1.2 was published after USB 2.0 but before USB 3.1 and so the information in BC1.2 refers to USB 2.0. The specification is, however, consistent and compatible with USB 3.1.</p> <p>Source: https://www.lightingglobal.org/wp-content/uploads/2017/12/Issue-24_USB-smartphone-charging-final.pdf, page 4</p>

	<p data-bbox="569 334 892 386">Our vision...</p>  <p data-bbox="562 873 1835 906">Source: https://usb.org/sites/default/files/D2T2-1%20-%20USB%20Power%20Delivery.pdf, page 5</p>

Claim	Analysis (All Emphasis Added)
	<p>3.2.4 Primary Detection</p> <p>Primary Detection is used to distinguish between an SDP and different types of Charging Ports. A PD is required to implement Primary Detection.</p> <p>3.2.4.1 Primary Detection, DCP</p> <p>Figure 3-6 shows how Primary Detection works when a PD is attached to a DCP.</p>  <p>Figure 3-6 Primary Detection, DCP</p>

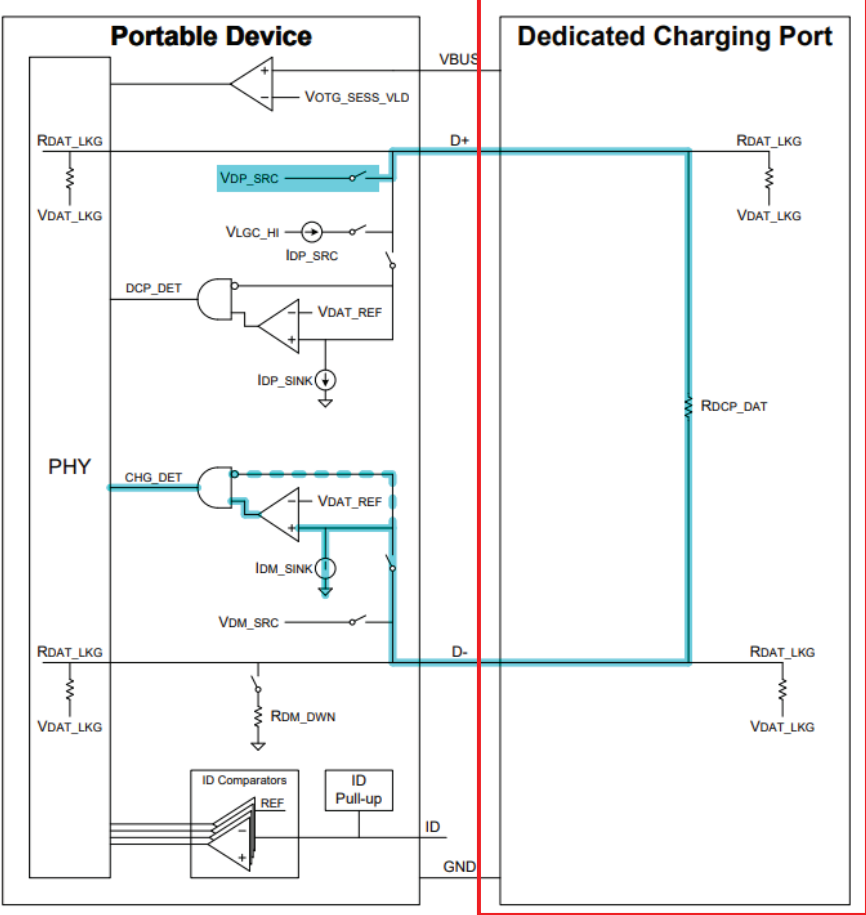

Claim	Analysis (All Emphasis Added)
	<p>Source: https://www.usb.org/sites/default/files/BCv1.2_070312_0.zip, USB Battery Charging Specification (Including errata and ECNs through March 15, 2012), Revision 1.2, March 15, 2012, Page 14</p> <p>Further, to charge the battery in a portable electronic device, the portable electronic device is connected to the Travel Power Adapter. The other end of the USB cable is connected to the charging port of the phone and the adapter is plugged into a standard wall socket. Therefore, the Travel Power Adapter comprises power circuitry to provide DC power to the phones.</p>
<p>[1.1] data circuitry configured to receive a first signal that originates from a portable electronic device and to provide a second signal to be sent to the portable electronic device, the data circuitry and the power circuitry configured to be coupled via a connector to the portable electronic device, the connector comprising a first conductor, a second conductor, a third conductor, and a fourth conductor, the connector configured to be detachably mated with a power input interface of</p>	<p>LG provides a power supply system comprising data circuitry configured to receive a first signal that originates from a portable electronic device and to provide a second signal to be sent to the portable electronic device, the data circuitry and the power circuitry configured to be coupled via a connector to the portable electronic device, the connector comprising a first conductor, a second conductor, a third conductor, and a fourth conductor, the connector configured to be detachably mated with a power input interface of the portable electronic device.</p> <p>This element is infringed literally, or in the alternative, under the doctrine of equivalents.</p> <p>For example, the Travel Power Adapter comprises data circuitry configured to use the Primary Detection method as described in the USB BC 1.2 specification.</p> <p>The Travel Power Adapter connects to the portable electronic device through a USB cable. The USB cable has a USB-C connector at one end to detachably mate with the charging port of portable electronic device. The connector comprises VBUS (“first conductor”), GND (“second conductor”), D+ (“third conductor”) and D- (“fourth conductor”) pins.</p> <p>Further, during Primary Detection, when a portable electronic device is connected with the Travel Power Adapter through the USB cable, the portable electronic device generates a D+ signal (“first signal”). Data circuitry of the Travel Power Adapter receives the D+ signal (“first signal”) and provides a D- signal (“second signal”) to the portable electronic device to detect the type of connected adapter (standard downstream port or charging port).</p>

Claim	Analysis (All Emphasis Added)
the portable electronic device to	<p>1.2 Background</p> <p>The USB ports on personal computers are convenient places for Portable Devices (PDs) to draw current for charging their batteries. This convenience has led to the creation of USB Chargers that simply expose a USB standard-A receptacle. This allows PDs to use the same USB cable to charge from either a PC or from a USB Charger.</p> <p>If a PD is attached to a USB host or hub, then the USB 2.0 specification requires that after connecting, a PD must draw less than:</p> <ul style="list-style-type: none"> • 2.5 mA average if the bus is suspended • 100 mA if bus is not suspended and not configured • 500 mA if bus is not suspended and configured for 500 mA <p><u>If a PD is attached to a Charging Port, (i.e. CDP, DCP, ACA-Dock or ACA), then it is allowed to draw IDEV CHG without having to be configured or follow the rules of suspend.</u></p> <p><u>In order for a PD to determine how much current it is allowed to draw from an upstream USB port, there need to be mechanisms that allow the PD to distinguish between a Standard Downstream Port and a Charging Port. This specification defines just such mechanisms.</u></p> <p>Since PDs can be attached to USB chargers from various manufacturers, it is important that all provide an acceptable user experience. This specification defines the requirements for a compliant USB charger, which is referred to in this spec as a USB Charger.</p> <p>Source: https://www.usb.org/sites/default/files/BCv1.2_070312_0.zip, USB Battery Charging Specification (Including errata and ECNs through March 15, 2012), Revision 1.2, March 15, 2012, Page 1</p>

Claim	Analysis (All Emphasis Added)
	<p>3.2.3.2 Problem Description</p> <p>USB plugs and receptacles are designed such that when the plug is inserted into the receptacle, the power pins make contact before the data pins make contact. This is illustrated in Figure 3-3.</p>  <p>The diagram illustrates the pin offset between a USB Plug and a Receptacle. The Plug is on the left, and the Receptacle is on the right. The Plug has four pins labeled VBUS, D-, D+, and GND from top to bottom. The Receptacle has four corresponding pins labeled VBUS, D-, D+, and GND from top to bottom. A red box labeled 'Connector' is positioned between the two, with a red arrow pointing from the D- pin of the Plug to the D- pin of the Receptacle. The VBUS and GND pins are aligned, while the D- and D+ pins are offset towards the VBUS side in the plug relative to the receptacle.</p> <p>Figure 3-3 Data Pin Offset</p> <p>Source: https://www.usb.org/sites/default/files/BCv1.2_070312_0.zip, USB Battery Charging Specification (Including errata and ECNs through March 15, 2012), Revision 1.2, March 15, 2012, Page 10</p>

Claim	Analysis (All Emphasis Added)
	<p>3. Charging Port Detection</p> <p>3.1 Overview</p> <p>Figure 3-1 shows several examples of a PD attached to an SDP or Charging Port.</p> <p>Figure 3-1 System Overview</p>

Claim	Analysis (All Emphasis Added)
	Source: https://www.usb.org/sites/default/files/BCv1.2_070312_0.zip , USB Battery Charging Specification (Including errata and ECNs through March 15, 2012), Revision 1.2, March 15, 2012, Page 6

Claim	Analysis (All Emphasis Added)
	<p>3.2.4 Primary Detection</p> <p>Primary Detection is used to distinguish between an SDP and different types of Charging Ports. A PD is required to implement Primary Detection.</p> <p>3.2.4.1 Primary Detection, DCP</p> <p>Figure 3-6 shows how Primary Detection works when a PD is attached to a DCP.</p>  <p style="text-align: center;">Figure 3-6 Primary Detection, DCP</p>

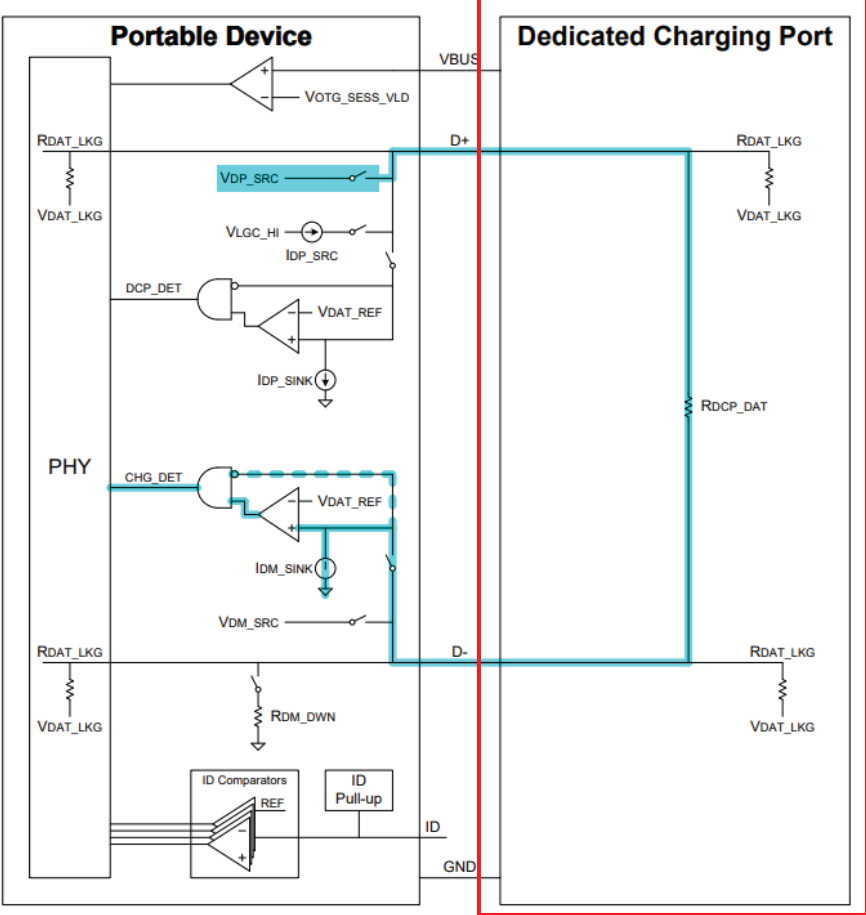

Claim	Analysis (All Emphasis Added)
	<p>Source: https://www.usb.org/sites/default/files/BCv1.2_070312_0.zip, USB Battery Charging Specification (Including errata and ECNs through March 15, 2012), Revision 1.2, March 15, 2012, Page 14</p> <p><u>During Primary Detection the PD shall turn on VDP_SRC and IDM_SINK. Since a DCP is required to short D+ to D- through a resistance of RDCP_DAT, the PD will detect a voltage on D- that is close to VDP_SRC.</u></p> <p>A PD shall compare the voltage on D- with VDAT_REF. If D- is greater than VDAT_REF, then the PD is allowed to detect that it is attached to either a DCP or CDP. A PD is optionally allowed to compare D- with VLGC as well, and only determine that it is attached to a DCP or CDP if D- is greater than VDAT_REF, but less than VLGC. The reason for this option is as follows.</p> <p>PS2 ports pull D+/- high. If a PD is attached to a PS2 port, and the PD only checks for D- greater than VDAT_REF, then a PD attached to a PS2 port would determine that it is attached to a DCP or CDP and proceed to draw IDEV_CHG. This much current could potentially damage a PS2 port. By only determining it is attached to DCP or CDP if D- is less than VLGC, the PD can avoid causing damage to a PS2 port.</p> <p>On the other hand, some proprietary chargers also pull D+/- high. If a PD is attached to one of these chargers, and it determined it was not attached to a charger because D- was greater than VLGC, then the PD would determine that it was attached to an SDP, and only be able to draw ISUSP.</p> <p>The choice of whether or not to compare D- to VLGC depends on whether the PD is more likely to be attached to a PS2 port, or to a proprietary charger.</p> <p>Source: https://www.usb.org/sites/default/files/BCv1.2_070312_0.zip, USB Battery Charging Specification (Including errata and ECNs through March 15, 2012), Revision 1.2, March 15, 2012, Page 15</p>

[1.4] transfer, via the third conductor, the first signal from the portable electronic device to the data circuitry, and	<p data-bbox="562 1239 1969 1307">LG provides a power supply system to transfer, via the third conductor, the first signal from the portable electronic device to the data circuitry.</p> <p data-bbox="562 1344 1692 1373">This element is infringed literally, or in the alternative, under the doctrine of equivalents.</p>

Claim	Analysis (All Emphasis Added)
	For example, the D+ pin provides the D+ signal (“first signal”) from the portable electronic device to the data circuitry of the Travel Power Adapter.

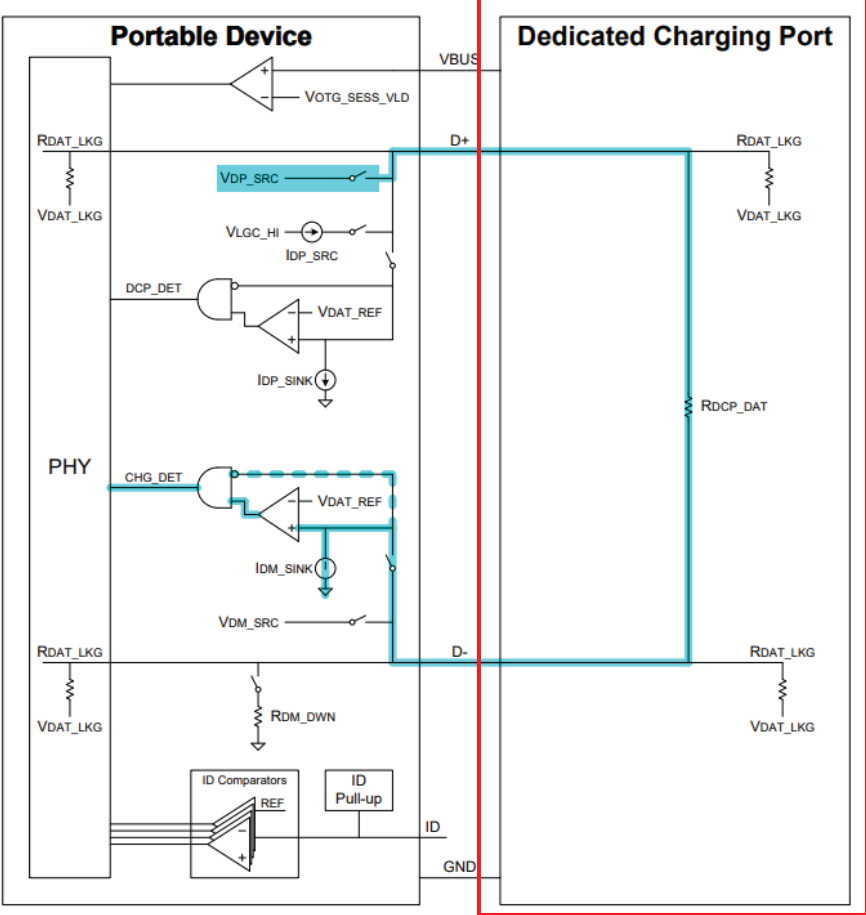

Claim	Analysis (All Emphasis Added)
	<p>3.2.4 Primary Detection</p> <p>Primary Detection is used to distinguish between an SDP and different types of Charging Ports. A PD is required to implement Primary Detection.</p> <p>3.2.4.1 Primary Detection, DCP</p> <p>Figure 3-6 shows how Primary Detection works when a PD is attached to a DCP.</p>  <p>Figure 3-6 Primary Detection, DCP</p>

Claim	Analysis (All Emphasis Added)
	<p>Source: https://www.usb.org/sites/default/files/BCv1.2_070312_0.zip, USB Battery Charging Specification (Including errata and ECNs through March 15, 2012), Revision 1.2, March 15, 2012, Page 14</p> <p><u>During Primary Detection the PD shall turn on VDP_SRC and IDM_SINK. Since a DCP is required to short D+ to D- through a resistance of RDCP_DAT, the PD will detect a voltage on D- that is close to VDP_SRC.</u></p> <p>A PD shall compare the voltage on D- with VDAT_REF. If D- is greater than VDAT_REF, then the PD is allowed to detect that it is attached to either a DCP or CDP. A PD is optionally allowed to compare D- with VLGC as well, and only determine that it is attached to a DCP or CDP if D- is greater than VDAT_REF, but less than VLGC. The reason for this option is as follows.</p> <p>PS2 ports pull D+/- high. If a PD is attached to a PS2 port, and the PD only checks for D- greater than VDAT_REF, then a PD attached to a PS2 port would determine that it is attached to a DCP or CDP and proceed to draw IDEV_CHG. This much current could potentially damage a PS2 port. By only determining it is attached to DCP or CDP if D- is less than VLGC, the PD can avoid causing damage to a PS2 port.</p> <p>On the other hand, some proprietary chargers also pull D+/- high. If a PD is attached to one of these chargers, and it determined it was not attached to a charger because D- was greater than VLGC, then the PD would determine that it was attached to an SDP, and only be able to draw ISUSP.</p> <p>The choice of whether or not to compare D- to VLGC depends on whether the PD is more likely to be attached to a PS2 port, or to a proprietary charger.</p> <p>Source: https://www.usb.org/sites/default/files/BCv1.2_070312_0.zip, USB Battery Charging Specification (Including errata and ECNs through March 15, 2012), Revision 1.2, March 15, 2012, Page 15</p>

Claim	Analysis (All Emphasis Added)
<p>[1.6] wherein the data circuitry is further configured, in coordination with the first signal, to provide the second signal, the second signal having a parameter level that is usable by the portable electronic device in connection with control of charging a rechargeable battery of the portable electronic device based on the direct current power provided by the power circuitry.</p>	<p>LG provides a power supply system wherein the data circuitry is further configured, in coordination with the first signal, to provide the second signal, the second signal having a parameter level that is usable by the portable electronic device in connection with control of charging a rechargeable battery of the portable electronic device based on the direct current power provided by the power circuitry.</p> <p>This element is infringed literally, or in the alternative, under the doctrine of equivalents.</p> <p>For example, the Travel Power Adapter shorts the D+ to D- through a resistance of RDCP_DAT, such that the portable electronic device detects a voltage on D-. Therefore, the data circuitry of the adapter is configured, in coordination with the D+ signal (“first signal”) to provide D- signal (“second signal”) to the portable electronic device.</p> <p>Further, the portable electronic device compares the D- signal’s voltage (“parameter”) level with a reference voltage to detect the type of adapter (standard downstream port or charging port). Based on the type of adapter, the portable electronic devices draw current to charge a rechargeable battery of the portable electronic device from the direct current power provided by the adapter.</p>

Claim	Analysis (All Emphasis Added)
	<p>1.1 Scope</p> <p>The Battery Charging Working Group is chartered with creating specifications that define limits as well as <u>detection, control and reporting mechanisms to permit devices to draw current in excess of the USB 2.0 specification for charging and/or powering up from dedicated chargers, hosts, hubs and charging downstream ports.</u> These mechanisms are backward compatible with USB 2.0 compliant hosts and peripherals.</p> <p>1.2 Background</p> <p>The USB ports on personal computers are convenient places for Portable Devices (PDs) to draw current for charging their batteries. This convenience has led to the creation of USB Chargers that simply expose a USB standard-A receptacle. This allows PDs to use the same USB cable to charge from either a PC or from a USB Charger.</p> <p>If a PD is attached to a USB host or hub, then the USB 2.0 specification requires that after connecting, a PD must draw less than:</p> <ul style="list-style-type: none"> • 2.5 mA average if the bus is suspended • 100 mA if bus is not suspended and not configured • 500 mA if bus is not suspended and configured for 500 mA <p><u>If a PD is attached to a Charging Port, (i.e. CDP, DCP, ACA-Dock or ACA), then it is allowed to draw <u>IDEV_CHG</u> without having to be configured or follow the rules of suspend.</u></p> <p><u>In order for a PD to determine how much current it is allowed to draw from an upstream USB port, there need to be mechanisms that allow the PD to distinguish between a Standard Downstream Port and a Charging Port. This specification defines just such mechanisms.</u></p> <p>Since PDs can be attached to USB chargers from various manufacturers, it is important that all provide an acceptable user experience. This specification defines the requirements for a compliant USB charger, which is referred to in this spec as a USB Charger.</p> <p>Source: https://www.usb.org/sites/default/files/BCv1.2_070312_0.zip, USB Battery Charging Specification (Including errata and ECNs through March 15, 2012), Revision 1.2, March 15, 2012, Page 1</p>
